EXPERIMENT 18

Exp No:18 Experiment to understand KNN algorithm for a given data set

AIM:
To understand KNN algorithm for a given data set

DESCRIPTION:
Understand the KNN algorithm for the dataset given.

CODE:

```
import numpy as np

import pandas as pd

df = pd.read_csv('/content/Iris.csv')

df.info()

print(df.Species.value_counts())

print(df.head())

features = df.iloc[:, 1:-1].values

label = df.iloc[:, 5].values

from sklearn.model_selection import train_test_split

xtrain, xtest, ytrain, ytest = train_test_split( features, label, test_size=0.2,

random_state=42)

from sklearn.neighbors import KNeighborsClassifier

model_KNN = KNeighborsClassifier(n_neighbors=5)

model_KNN.fit(xtrain, ytrain)

print(model_KNN.score(xtrain, ytrain))
```

```
print(model_KNN.score(xtest, ytest))

from sklearn.metrics import confusion_matrix

print(confusion_matrix(ytest, model_KNN.predict(xtest)))

from sklearn.metrics import classification_report

print(classification_report(ytest, model_KNN.predict(xtest)))
```

RESULT:

Thus, the K-Nearest Neighbors (KNN) algorithm was implemented successfully to classify Iris flower species. The model achieved 96.67% accuracy on the test dataset and was evaluated using a confusion matrix and classification report.
